

1. Enter the Events in the JS

Answer :

1. click : This event is triggered when the user presses and releases the mouse button on an element like a button, div, or link
2. dblclick : This event occurs when the user performs two quick consecutive clicks on the same element.
It is used to detect double-click actions.
3. Mouseover : This event fires when the mouse pointer enters the boundary area of an element.
It is commonly used for hover effects.
4. Mouseout : This event triggers when the mouse pointer leaves the boundary of an element.
It is used to remove hover effects or change UI when the mouse moves away.
5. Keyup : This event occurs when the user releases a key on the keyboard.
Useful for detecting typed input after the keypress is completed.
6. Keydown : This event triggers the moment a key is pressed down (before releasing).
Used for shortcuts, live typing detection, and controls.
7. Change : This event fires when the value of an input element (text field, checkbox, dropdown) is changed and the element loses focus or confirms the change.
Used to detect updated input values.
8. Submit : This event occurs when a form is submitted using a button or Enter key.
It allows JavaScript to handle form validation before sending data.

9. Load : This event fires when the entire webpage, including images, scripts, and styles, has fully loaded in the browser.

Used to run code after the page is completely ready.

2. Callback promises async and await theory. ?

Answer :

Callback : A callback is simply a function passed as an argument to another function, which is then executed once an asynchronous operation is complete.

Promises : A Promise is an object that represents the eventual completion of an asynchronous operation and its resulting value. They were introduced to solve the callback hell problem.

Async/Await : Async/Await is a modern syntax built on top of Promises that allows you to write asynchronous code that looks and behaves like synchronous code.

3. . NODE Installation - Completed

4. . VS code Installation – Completed

5. What is React Main Concept in React in your point of view?

Answer : In my point of view, the main concept of React is building UI using small, reusable components.

Instead of creating one big page, React allows us to break the UI into smaller pieces like buttons, cards, forms,

headers, etc. Each component has its own structure, style, and logic.

React also updates only the part of the screen that changes, using the Virtual DOM, which makes the UI fast and smooth.

React Main Concepts :

Components

JSX

Props

State

The Virtual DOM

Lifecycle Methods (or Hooks)

Event Handling

Conditional Rendering

Lists and Keys

Forms

Context

Hooks

6. how much you know the react.

Answer : I don't have working experience in React, but I have learnt the basics. I know how components work, how to use props and state, and how React updates the UI. I am still learning, but I am very interested in React and I want to build apps using it.

7. What is your goal in this class?

Answer : I want to become a perfect developer and also learn how to lead a team. My goal is to take my team to the top position in the class. I want to improve my skills, help my teammates, share knowledge, and work together.

8. where you see in the next 3 month?

Answer : In the next 3 months, I want to see myself with stronger skills in MERN. I want to complete more projects, improve my confidence. I also want to be ready for internships or job opportunities. My main aim is to become a more responsible and skilled developer.

9. File Handling - Folder Handling MUST

Answer : File handling and folder handling help me to keep my projects neat and safe I can specify files properly to store data correctly and easily this makes my projects clean, safe, and easier to work with
